

Curling pour Enfants 2015

Cadre crânien Sugita

Cette station de travail pour la neurochirurgie est utilisée pour stabiliser la tête du patient pendant la neurochirurgie. Cette station d'immobilisation à six points permet un maximum de soutien et de stabilité tout au long de la procédure, particulièrement en pédiatrie.

Avec le cadre crânien Sugita, le chirurgien a la liberté de positionner la tête de l'enfant dans un angle précis, ce qui augmente la précision lors de microchirurgies. Les neurochirurgiens dépendent de la stabilité du patient, de la minutie de l'équipe médicale et de la stabilité de leur équipement. Avec le cadre crânien Sugita, les enfants sont stabilisés et immobilisés de manière telle que le chirurgien puisse opérer sans s'inquiéter que des mouvements involontaires brusques ne surviennent.

Year 4 of the Naming Opportunity at the New Children's Hospital (\$300,000 pledged over 5 years)

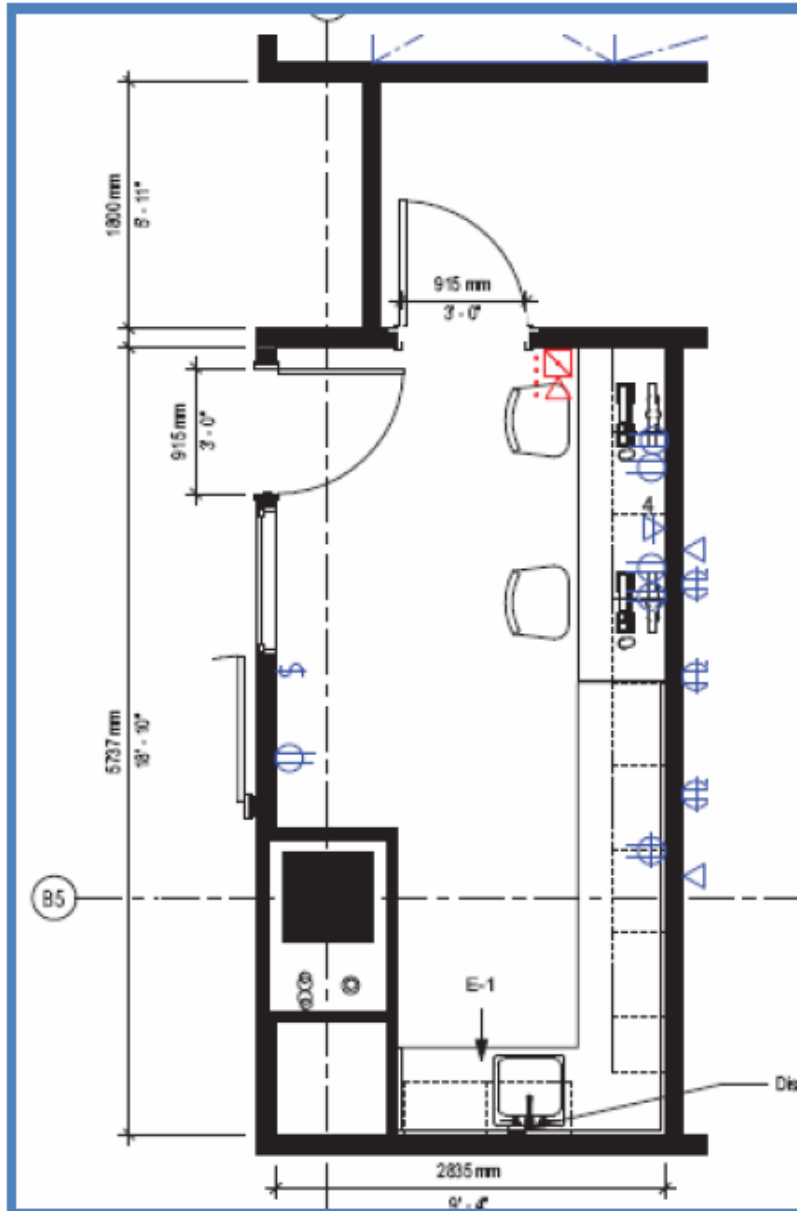

"Kurling for Kids" Playroom on the Medical/Surgical Ward - Location: 8th Floor, Pavillion B, Size: 14.29 m² (154 ft²)

Plan of 8th floor medical/surgical unit showing location of playroom

The medical/surgical pediatric patient care units will provide high-quality care to general medical and surgical patients who require admission to the hospital. The age group that will be admitted includes those from infant through age 18. This floor will accommodate hospitalized patients, as well as patients admitted to the short stay unit directly from the Emergency Department. All 34 patient rooms will be single, with private washrooms and place for a parent to spend the night. The projected occupancy rate on the wards is about 85%.

As this unit will be running on a 24-hour basis, the child life specialists will have the opportunity to organize a multitude of activities for the patients, including arts & crafts, movie nights and readings, all of which will cater to various age groups. This enclosed, dedicated space will be equipped with toys, books, computer workstations, a sink and adjacent space for storage.
